Person to Person Health Interview Study

A part of the Precision Health Initiative, this study brings the voices of the people to understanding Indiana’s health challenges.
THANK YOU FOR SHARING

Now it’s our turn. Let’s stay in touch so we can share what we learn from the study—and tell you about future health studies. Your interview responses remain confidential, and your contact information will too. Please be on the lookout for a request to update or verify your information. We’ll send more findings over time.

PROGRESS SINCE OCTOBER 2018

1,680 HOUSEHOLDS

Participants live in 41 counties—urban, rural, and mixed—and their ages range from 18 to 104 years old.

17% MINORITY

Participants come from many backgrounds: American Indian/Alaska Native, Asian, black, Native Hawaiian/Pacific Islander, and white.

1 in 5 IMPACTED BY DRUGS

More than 360 participants say they know at least three people with drug abuse problems.

61% STRUGGLE WITH WEIGHT ISSUES

Nearly 1,030 participants report their own family has dealt with obesity or being overweight.

WHY PARTICIPATION MATTERS

You’re helping researchers to …

- Learn about the health concerns and attitudes of Indiana residents in their own words
- Determine how common health issues are, including obesity, substance abuse, diabetes, and cancer
- Connect genetic risk factors and social environments to disease outcomes
- Inform state officials of important public health needs

WHAT’S NEXT

- Interviews are expected to end April 2021
- We analyze and share top findings
- We work with partners to decide if the study should be ongoing

UPDATED STATS AS OF JULY 15, 2020
